

Network Analysis and Application Performance Measurement

- ✓ *No need to install agents*
- ✓ *Rapid automated analysis with more than 20 built-in reporting widgets*
- ✓ *Data can be readily exported for reporting purposes*
- ✓ *Realistic & affordable pricing*
- ✓ *Available as a desktop hardware appliance or virtual appliance*

Network services without the long, hard slog...

The first step in many Network and Application Performance engagements is to audit the network. Doing it manually is very time consuming, requires specialist knowledge, is difficult to repeat, doesn't scale, and at the end of all that effort, the results are usually unreliable and incomplete. It is very rarely possible to do a full, comprehensive, detailed analysis of a customer's network at an affordable price.

NE-ONE Profiler enables you to offer a wide range of network and application performance assessment services to your customer because the discovery and analysis is automated and simplified, which means services can be priced affordably to your customers and you can still make a good margin.

Project Use Cases include:

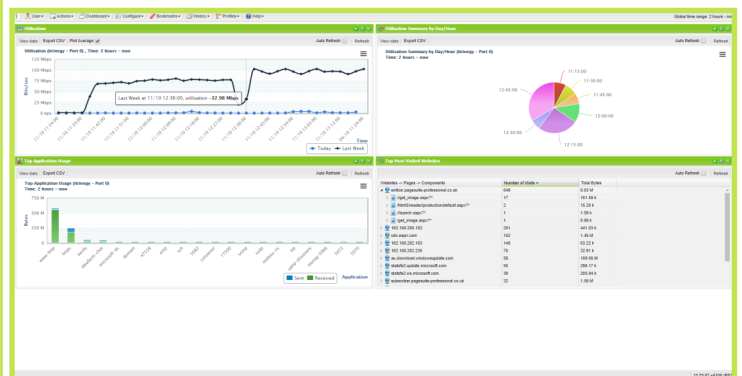

- Health Checks & Audits
- Application Performance Trouble-shooting
- Application Performance Measurement
- Cloud Migrations
- Data Center Moves
- Network Sizing
- SLA Reporting

With NE-ONE Profiler you no longer need in-depth packet level technical skills to be able to offer network and application visibility services. You can use the information provided to create powerful and valuable reports for your customers that help make you the trusted advisor and move up the value chain.

NE-ONE Profiler from iTrinegy is a reporting tool for networks which provides rapid discovery and analysis of a customer's network. There are more than 20 built-in reporting widgets using time-line, bar, pie, tree and tabular charts which can be exported for use in reports and proposals.

NE-ONE Profiler is non-intrusive - there are no agents or probes - and so is deployable very quickly. It is provided as a physical

portable appliance or virtual appliance and it's so easy to use that no training is required. NE-ONE Profiler delivers complete insight into a customer's network and application environment.

Built-in reporting widgets provide information including bandwidth, protocols, IP Addresses, response times, sessions, and data loss on the dashboard. Reports can be exported to Excel, PDF, PNG and a variety of other standard formats for you to include in your proposals and reports to your customers.

NE-ONE Profiler is a powerful reporting tool that complements rather than competes with existing operational products. It does not attempt to replace them although there may be some occasions where the customer decides to purchase it either as an operational tool or on-going reporting service.

OPTIONAL CARRY CASE

To ensure your NE-ONE Profiler is protected we offer a military-grade ruggedized carry case option for transporting the physical hardware appliance between customer assignments.

BOOK A DEMONSTRATION OR REQUEST A FREE TRIAL
